

Database Design

Pair Practice: Using your Database Script

Instructions

For this activity, you will need to make sure you and your partner have both completed the **Practice: Generating a Database Script** activity.

Using both your script and your partner's, create and adapt a database for one of the following scenarios:

1. You're developing a database for "Urban Eats," a restaurant chain that operates multiple locations across the city. Each restaurant has its own menu (though some items overlap), and they need to track customer orders across all locations for analytics, inventory management, and customer loyalty programs.
2. You're developing a library system that needs to expand to serve multiple departments in a university, tracking both library resources and course materials.
3. You're building a database for "Premier Events Co.," an event planning company that manages various types of events across multiple venues in the region. They handle everything from corporate conferences and weddings to concerts and trade shows. The company needs to track venue bookings, manage ticket sales, and coordinate with different venue partners.

Setup

For this activity, you will need to use the repositories you and your partner completed for the **Practice: Generating a Database Script** activity.

1. Create a new branch.
2. Name it: pair-practice-databaseScript-[Your First Name]-[Your Last Initial]
3. Make sure your partner is added as a collaborator on the repo.
4. Clone the repository to your local machine.
5. Start working on the code.

Submission

Submit the url for you and your partner's GitHub repos in the field below.
